With the help of: ATmega328P Datasheet

I²C: Inter Integrated Circuit

- Also known as Two Wire Interface (TWI)
- Allows up to 128 different devices to be connected using only two bi-directional bus lines, one for clock (SCL) and one for data (SDA).
- A pull-up resistor (typically 10 k Ω) is needed for each of the TWI bus lines.
- All devices connected to the bus have individual addresses.

I²C Terminologies

- I²C (TWI) protocol allows several devices (up to 128) to be connected.
- Each device is identified by a configurable 7-bit address.
- Each device can communicate with any other device
 - The transmitter address the receiver by its 7-bit address.

Term	Description
Master	The device that initiates and terminates a transmission. The Master also generates the SCL clock.
Slave	The device addressed by a Master.
Transmitter	The device placing data on the bus.
Receiver	The device reading data from the bus.

Table 21-1.TWI Terminology

I²C START and STOP Conditions

- START and STOP conditions are signaled by changing the level of the SDA line when the SCL line is high.
- When a new START condition is issued between a START and STOP condition, this is referred to as a REPEATED START condition

I²C Address Packet Format

- All address packets transmitted on the TWI bus are 9 bits long:
 - 7 address bits, one READ/WRITE control bit and an acknowledge bit.
- When a Slave recognizes that it is being addressed, it should acknowledge by pulling SDA low in the ninth SCL (ACK) cycle.
- The Master can then transmit a STOP condition, or a REPEATED START condition to initiate a new transmission.

I²C Data Packet Format

- All data packets transmitted on the TWI bus are 9 bits long:
 - One data byte and one acknowledge bit.
- An Acknowledge (ACK) is signaled by the Receiver pulling the SDA line low during the ninth SCL cycle. If the Receiver leaves the SDA line high, a NACK is signaled.

Figure 21-5. Data Packet Format

I²C Bus Arbitration

- Arbitration is carried out by all masters continuously monitoring the SDA line after outputting data.
- If the value read from the SDA line does not match the value the Master had output, it has lost the arbitration.

Figure 21-8. Arbitration Between Two Masters

A typical I²C Transmission

Figure 21-10. Interfacing the Application to the TWI in a Typical Transmission

A typical I²C Transmission Summary

- When the TWI has finished an operation and expects application response, the TWINT Flag is set. The SCL line is pulled low until TWINT is cleared.
- When the TWINT Flag is set, the user must update all TWI Registers with the value relevant for the next TWI bus cycle. As an example, TWDR must be loaded with the value to be transmitted in the next bus cycle.
- After all TWI Register updates and other pending application software tasks have been completed, TWCR is written. When writing TWCR, the TWINT bit should be set.
- Writing a one to TWINT clears the flag. The TWI will then commence executing whatever operation was specified by the TWCR setting.

I²C Transmission Example

Note: The code above assumes that several definitions have been made, for example by using include-files.

I²C Reception Example

void TWI_Slave_Initialize(uint8_t Address)

{

{

TWAR = (Address << 1)|(1); TWCR = (1<<TWEA)|(1<<TWEN);

// Load Slave Address into TWAR Register.
// Enable TWI & Acknowledgements.

// Read TWDR Register.

```
uint8_t TWI_Slave_Receive(void)
```

```
TWCR = (1<<TWEA) | (1<<TWEN);

while (!(TWCR & (1<<TWINT)));

if ((TWSR & 0xF8) != 0x60)

ERROR();

TWCR = (1<<TWINT) | (1<<TWEN);

while (!(TWCR & (1<<TWINT)));

if ((TWSR & 0xF8) != 0x80)

ERROR();

TWCR = (1<<TWINT) | (1<<TWEN);

return TWDR;
```

```
// Enable TWI & Acknowledgements.
// Wait for TWINT Flag set (once this slave is addressed)
// Check value of TWI Status Register.
// Clear TWINT bit start reception of data.
// Wait for TWINT Flag set.
// Check if Data has been received & ACK has been returned
// Clear TWINT bit.
```

Note: The code above assumes that several definitions have been made, for example by using include-files.

Task1: I²C Master Slave Communication

Write a program to send ADC voltage readings to your friend's board over I^2C bus.

- Configure your board as I²C Master (f_{SCL} = 200kHz) and ask your friend to configure his as I²C Slave.
- Make proper wire connections of SCK and SDA pins between the two boards.
 Don't forget to put a 10 kΩ pullup resister on each line.
- In Master MCU, read a potentiometer's voltage through ADC every 100ms (only upper 8 bits).
- Transmit Master's voltage value every 100ms.
- For Master, print the transmitted reading on UART.
- For Slave, print the received reading on UART.

Homework: Use I^2C interrupts on both Master and Slave sides for non-blocking I^2C implementation.
